

Creating Match and Player Views

A detail view lets a user move from a summary to the record needed for a task.

Receive a validated identifier

```
$matchId = trim($_GET["match_id"] ?? "");  
if ($matchId === "" || mb_strlen($matchId) > 20) {  
    exit("Invalid match.");  
}  
  
$stmt = $pdo->prepare(  
    "SELECT match_id, team_name, wins, losses  
    FROM team_results  
    WHERE match_id = :match_id"  
);  
$stmt->execute(["match_id" => $matchId]);  
$match = $stmt->fetch();  
  
if (!$match) {  
    http_response_code(404);  
    exit("Match not found.");  
}
```

Display escaped values with headings that explain the record. Provide a logical way back to the summary.

For player views, use an appropriate relationship and do not invent personal data. All names and records must be fictional.

Check

- ☐ Identifier is validated.
 - ☐ Query is prepared.
 - ☐ Missing record has a 404 response.
 - ☐ Output supports the user's journey.
 - ☐ Text is escaped and data is fictional.
-
